# From Voice to Cognitive Insights: Building KinaBot, an AI System for Early Cognitive Awareness

Almoji

# Record Speech Data, Compare Over Many Time Points

## Input

Any conversation
(Any language*)

## Analyze

- Using Natural Language Processing (NLP), and LLMs.
- Analyze voice features
- Analyze grammar & vocabulary
- Owned Intellectual Property

## Output

- Individual baseline
- Voice and Grammar Score each time
- Visualization to show decline by score on specific indicator

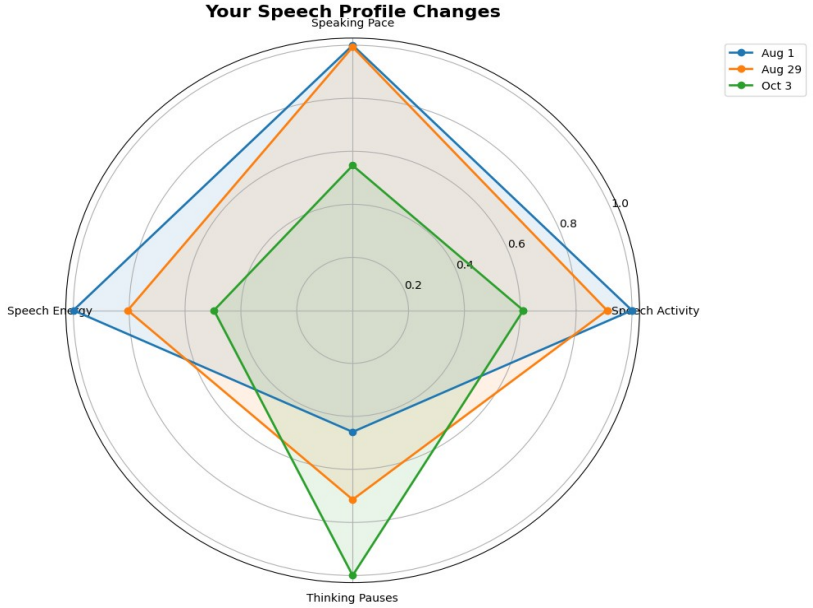

*Note: Now available in English and Japanese

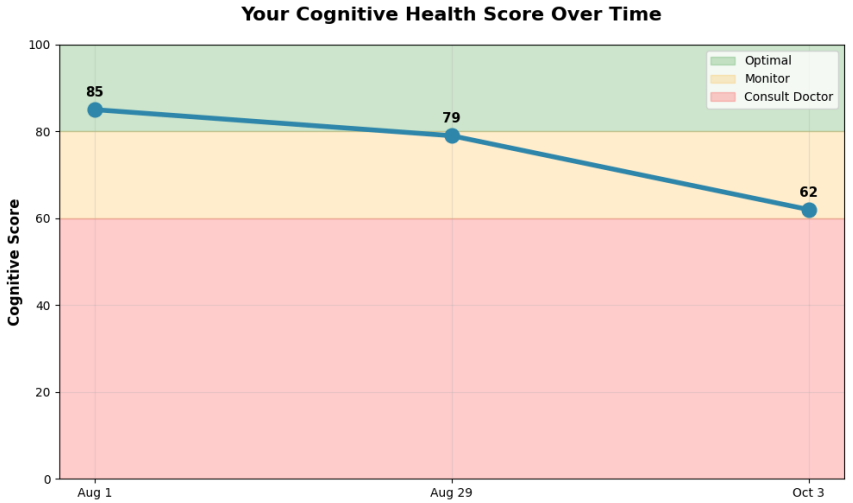

## Product

**KinaBot – Everyday Speech-Based Brain Health Barometer**

## Technology Highlights

1. **Everyday speech → brain health indicators**
   Analyzes acoustic + linguistic features from natural conversation to estimate cognitive trends over time.
2. **Non-medical, explainable AI dashboard**
   Provides easy-to-understand graphs and indicators (not a medical device) to support early awareness and doctor consultation.
3. **Multilingual, privacy-first platform**
   Designed for aging populations and families in **Japan / US**, supporting multiple languages with strict data protection.

## Use Case Overview

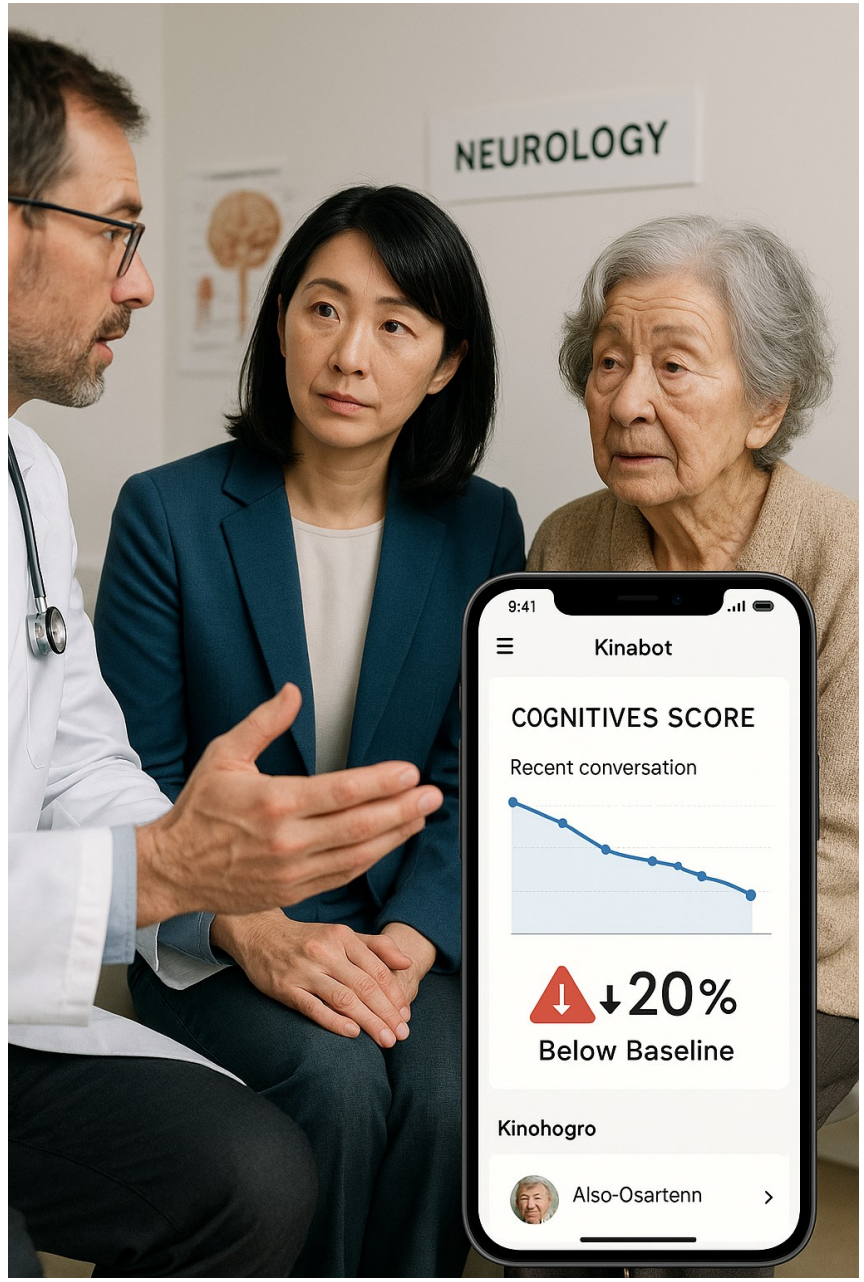

Living in California  worrying about her aging grandmother’s brain health.
Using **KinaBot** to analyze grandma’s daily conversation whenever they talk through phone. The system calculates language score from voice and speech, tracks and monitors cognitive trends over months, not just one-time tests.

## Problem

Families often **notice cognitive decline too late**, after serious and clear symptoms appear.
Traditional assessments are **infrequent, clinical, and stressful** for older adults.

## Solution

**KinaBot** turns **natural, low-stress conversation** (at home, in daily life) into **non-medical language ability indicators**.
The platform shows **trend graphs and simple alerts** when indicators shift over time, prompting early awareness.
Families and care providers can use these insights to **start a conversation and recommend a professional**
