Your AI is lying to you.

Not malicious. It fills gaps with full confidence.

Presented by Vanchhit Khare

LLMs are pattern completers, not fact retrievers.

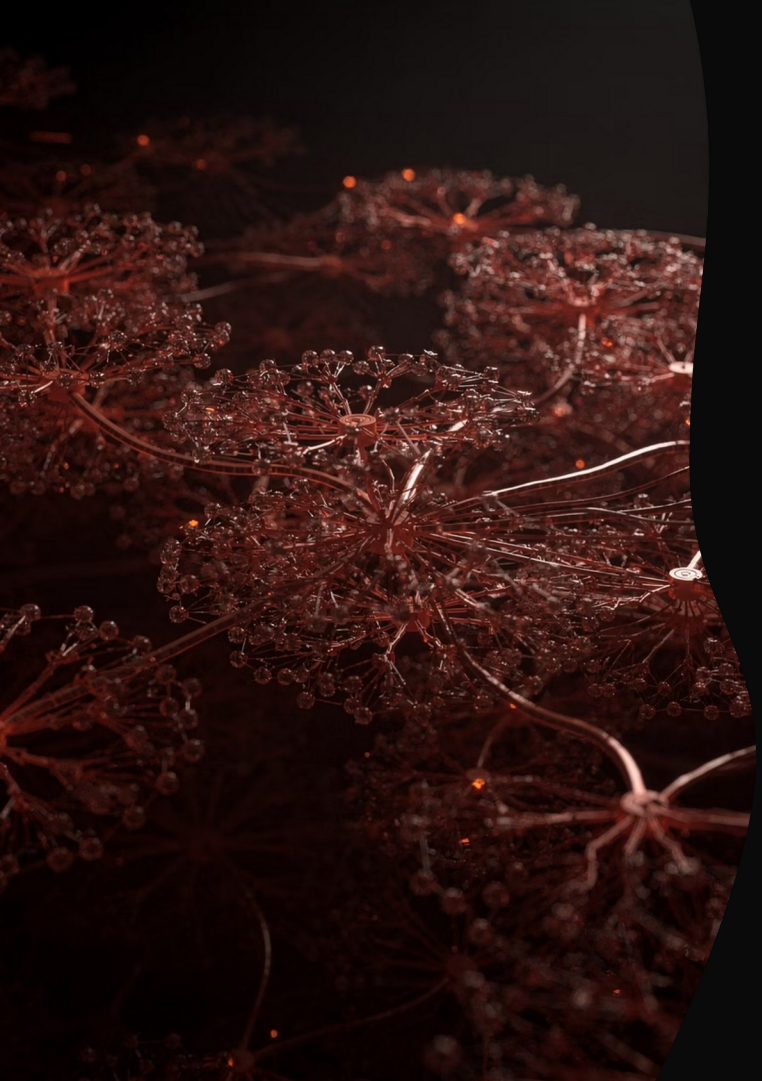

Trained once, frozen
No memory between sessions

Asked about the gap
It guesses, confidently

Every session resets
NotebookLM, ChatGPT, Notion AI, same flaw

⚠ "Your knowledge never compounds. The AI never gets smarter about your domain." " Andrej Karpathy

Karpathy figured this out in April.

421K views. A simple two folder system that makes your AI actually remember.

raw/

You dump sources. AI reads, never modifies. Ground truth stays intact.

wiki/

AI builds and maintains. Summaries, cross-links, contradiction flags, automatically.

30 days in: **50 80 interconnected pages.** Notes from months ago surface exactly when you need them.

Best builders don't know more. **They forget less.**

Your second brain needs an API.

Why Notion beats Obsidian

Obsidian is a writing tool. Notion is a **system** with full REST API and native MCP server support. AI can read *and write* without hacks.

> ⓘ If you want AI to maintain your second brain, it needs write access. Notion gives you that out of the box.

Obsidian	Notion
Local markdown files	Structured database
No native API	Full REST API
Plugin hell	MCP server: native
AI can't write to it	AI writes & reads natively
Writing tool	Knowledge system

YouTube is where practitioners learn. And it all evaporates.

You watch a 90 min talk

Learn things. Close the tab.

No structure. Not queryable.

No transcript in your brain or your AI's context.

Classic hallucination trigger

AI asked about content it was never given. It guesses.

What if every YouTube video you watched became a queryable Notion page automatically?

YouTube URL in. Structured Notion page out.

Why MCP matters

MCP grounds the write. AI can't hallucinate into your database. It writes structured facts, not guesses.

Four agents. One job each.

The Notion MCP layer is the grounding layer. AI stops retrieving from weights. It reads from **ground truth.**

Let's do it live.

01

Paste a YouTube URL

A recent AI conference talk the audience knows

02

Run the pipeline

Four agents fire in sequence

03

Notion page appears

Title, summary, key concepts, timestamps, structured

04

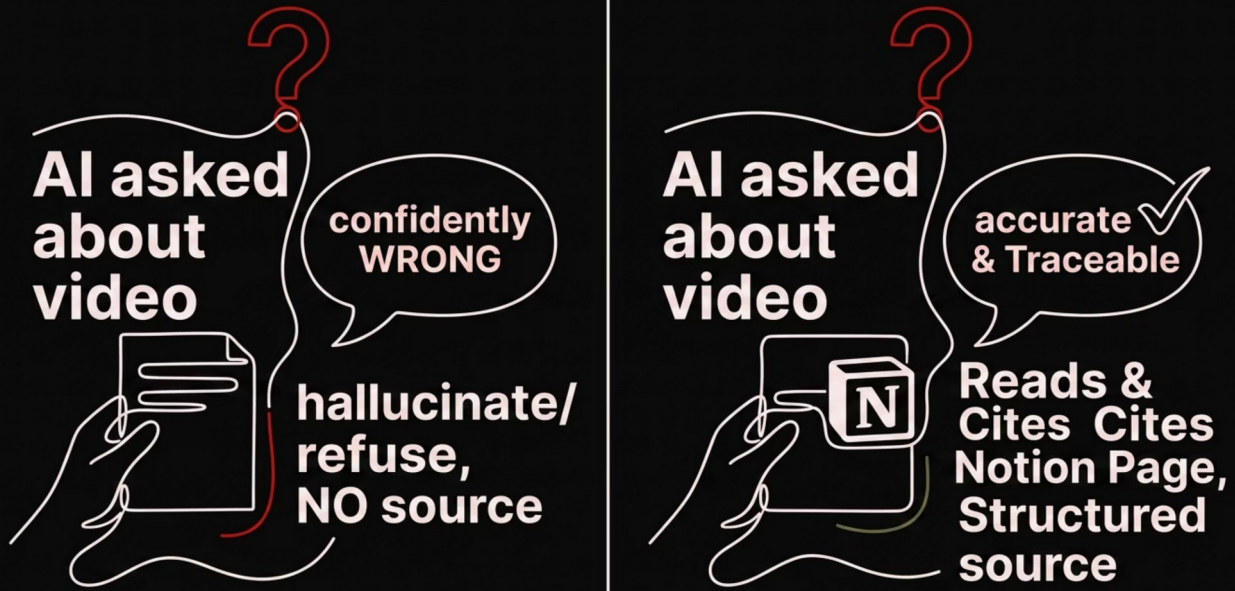

Ask Claude a question

It reads from Notion. Cites it. Doesn't hallucinate.

⚠ Backup: pre-recorded screen capture if wifi dies. Have it ready.

That's grounding. Not magic.

Grounding = replacing weight based recall with **structured fact retrieval.**
Works for YouTube, meeting transcripts, Slack threads, Notion docs. Same pattern every time.

The full AI second brain stack.

1

Layer 1: Ingestion Agents

YouTube, PDFs, web pages, meeting transcripts

2

Layer 2: Structured Notion DB

Queryable, MCP-accessible, always growing

3

Layer 3: AI Queries DB

Reads structured facts not its frozen weights

The compounding effect

Every source you add shrinks the hallucination surface. Your AI gets smarter about *your* domain not the internet's.

Knowledge compounds. Hallucinations shrink. You forget less.

Stop asking AI to remember. Give it something to read.

Grounding

Structured store + retrieval before generation

Your second brain

Only useful if your AI can query it

Build it today

The model isn't the problem. Missing context is.
